ROAS - Mean: 6439.07

ROAS - Max: 504395.37

ROAS - Min: 0.26

Profit - Mean: 513530.52

Profit - Max: 4579900.92

Profit - Min: -11143.0

AI Analysis

****Business Domain:****

Based on the provided dataset, the business domain appears to be digital marketing, specifically performance marketing, with a focus on social media advertising and influencer marketing.

****Key Insights:****

1. ****High Revenue and Profit:**** The dataset shows high revenue and profit averages, indicating successful performance marketing campaigns. However, the data also suggests a wide range of revenue and profit values (Max: 4579910 and Max: 4579900.92, respectively), which may indicate variations in campaign performance.
2. ****Low Acquisition Cost:**** The mean acquisition cost is relatively low (376.09), which suggests that the campaigns are generating revenue at a reasonable cost. However, the high ROI variability (Min: -0.99) may indicate that some campaigns are more expensive to acquire customers than others.
3. ****Engagement Score Variation:**** The engagement score, which is calculated as an unknown metric, varies widely (Min: 2.56 and Max: 30.99). This may indicate that the campaigns have different levels of engagement, which can impact campaign performance.

****Top 3 Recommendations:****

1. ****Segmentation Analysis:**** Analyze the data to segment customers by demographic, behavioral, and firmographic attributes. This can help identify the most profitable customer segments and inform targeting strategies for future campaigns.
2. ****Campaign Type Optimization:**** Evaluate the performance of different campaign types (e.g., social media, influencer, paid ads) to determine which type(s) are driving the highest revenue and profit. This can help inform media planning and budget allocation decisions.
3. ****Channel Attribution Modeling:**** Use more advanced attribution modeling techniques (e.g., linear, time-decay, multi-touch) to better understand the impact of individual channels (WhatsApp, YouTube, Google) on campaign performance. This can help optimize channel allocation and reduce waste.

Additional suggestions:

- * Explore the impact of campaign duration on performance (e.g., longer campaigns may lead to lower CTR and ROI).
- * Investigate the relationship between engagement scores and campaign performance to identify patterns or correlations.
- * Develop models to predict customer lifetime value (CLV) based on the available data, which can help inform customer acquisition strategies.

Please note that these recommendations are based on a limited analysis and may require further exploration and validation based on a more comprehensive analysis of the data.
